

UEFI & EDK II Training

Build Setup and Download EDK II Lab - Linux

tianocore.org

Copy and Paste see [Lab Guide.md](#)

PLATFORM BUILD LABS

-  Setup and Install Applications
-  Download the EDK II Source
-  Build BaseTools

Install Applications for EDK II

Setup build environment

Pre-requisites Ubuntu 20.04

Example Ubuntu 20.04

The following need to be accessible for building Edk2, From the terminal prompt (Ctrl-Alt-T):

```
bash$ sudo apt install build-essential uuid-dev iasl git python-is-python3
```

- build-essential - Informational list of build-essential packages
- uuid-dev - Universally Unique ID library (headers and static libraries)
- iasl - Intel ASL compiler/decompiler (also provided by acpica-tools)
- git - support for git revision control system
- nasm - General-purpose x86 assembler (see below to install 2.15.05 or above)
- python-is-python3 - Ubuntu 20.04 python command is 'python3' but edk2 tools use 'python'

Now need Nasm 2.15.x <https://www.linuxfromscratch.org/blfs/view/cvs/general/nasm.html>

The Following is needed for Mounting a .VHD file to use with Simics

```
bash$ sudo apt install libguestfs-tools
```

The following will install the QEMU for Intel X86 & 64 bit

```
bash$ sudo apt install qemu-system-x86-64
```

ubuntu

See Lab guide for Ubuntu 16.04 pre-requisites

Pre-requisites Clear Linux* Project

Example Using Clear Linux* Project

The following need to be accessible for building Edk2, From the terminal prompt (Ctrl-Alt-T):

```
bash$ sudo swupd bundle-add devpkg-util-linux
```

Devpkg-util-linux – includes bundles for developer tools for writing “C” Applications included:
gcc, nasm, uuid, etc.

```
bash$ sudo swupd bundle-add kvm-host
```

Qemu – Emulation with Intel architecture with UEFI Shell

Setup Simics Environment

Download and Install the Simics Simulator
(both Package Manager & Simics-6
Packages) [Simics® Simulator Public Release](#)

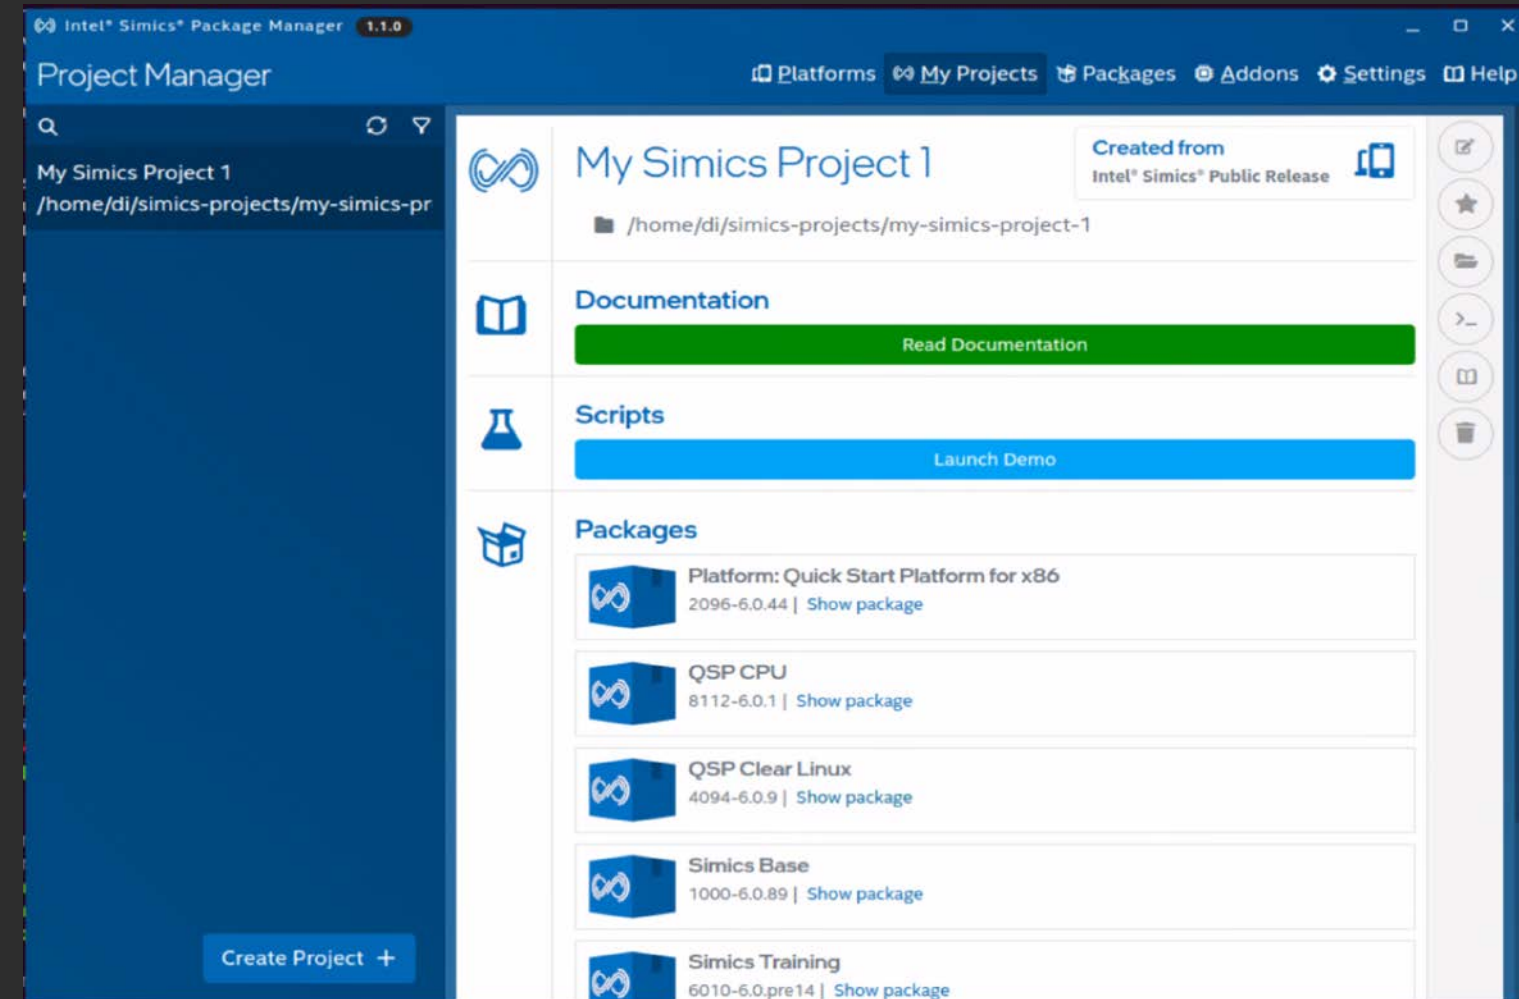

Setup the Simics Simulator

[Simics® Simulator Installation and Get Started](#)

Open the “Intel Simics Package Manager”

1. On Linux, run the ispm-gui application from inside the unpacked directory.
2. Note If the application fails to start on older Linux versions, you may have to start the application with the --no-sandbox option, as ispm-gui --no-sandbox.

Here is a snapshot of Intel Simics Package Manager with “My Simics Project 1” created

Create QEMU Run Script

1. Create a run-ovmf directory under the home directory

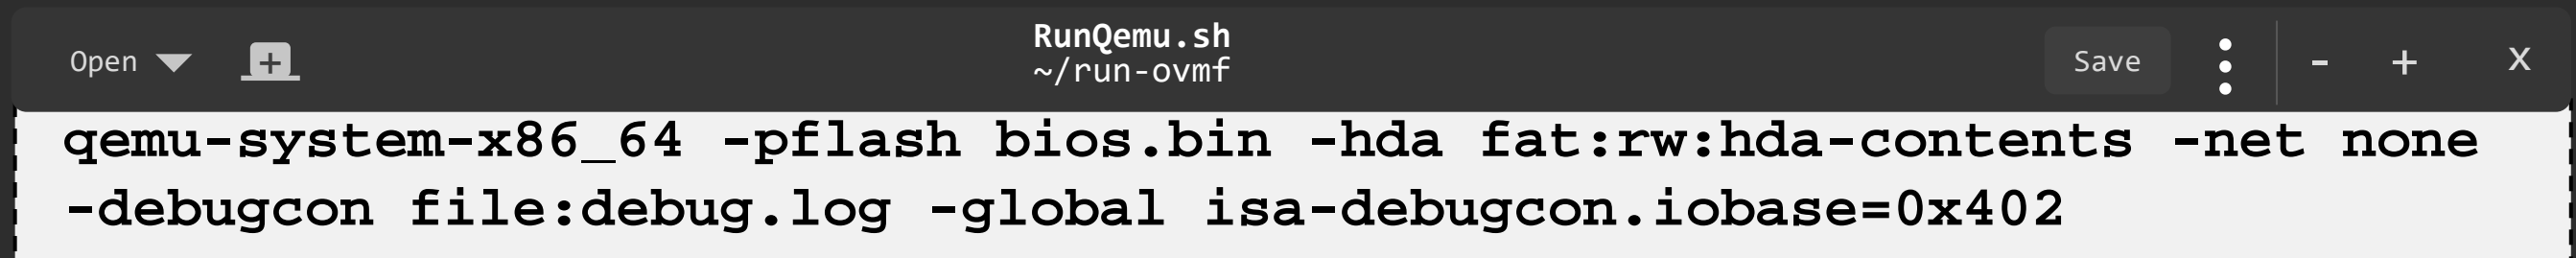

```
$ cd ~  
$ mkdir ~run-ovmf  
$ cd run-ovmf
```

2. Create a directory to use as a hard disk image

```
$ mkdir hda-contents
```

3. Create a Linux shell script to run the QEMU from the run-ovmf directory

```
$ gedit RunQemu.sh
```

The screenshot shows a text editor window titled "RunQemu.sh" with the path "~/run-ovmf". The window contains the following command:

```
qemu-system-x86_64 -pflash bios.bin -hda fat:rw:hda-contents -net none  
-debugcon file:debug.log -global isa-debugcon.iobase=0x402
```

4. Save and Exit

Download EDK II Source

Download Source and Lab Materials

Create Workspace Directory

Open Terminal Command Prompt

Make new directory for Workspace:

```
$ cd $HOME  
$ mkdir fw  
$ cd fw  
$ mkdir edk2-ws  
$ cd edk2-ws
```

Download EDK II Open Source

Download the open source EDK II from GitHub 

Note if behind a firewall, set PROXYS FIRST (example shows for Intel Corp. – Maybe different for your Corp. or GEO)

```
$ git config --global https.proxy proxy-dmz.intel.com:912  
$ git config --global http.proxy proxy-dmz.intel.com:911
```

From the command prompt use “git clone” to download the following Repos

- Edk2 – main core code

```
$ git clone -b Edk2Lab_22Q3 https://github.com/tianocore-training/edk2.git
```

- EDK II “C” Library Repo

```
$ git clone https://github.com/tianocore/edk2-libc.git
```

- EDK II Platforms Repo

```
$ git clone https://github.com/tianocore/edk2-platforms.git
```

- EDK II Non-OSI (Stand alone Binaries)

```
$ git clone https://github.com/tianocore/edk2-non-osl.git
```

- Intel FSP

```
$ git clone https://github.com/Intel/FSP.git
```

Download the EDK II Submodules

Download the EDK II Submodules from GitHub

Download the Submodules and Checkout the Lab Branch

```
$ ~/fw/edk2-ws> cd edk2  
$ ~/fw/edk2-ws/edk2> git submodule update --init  
$ ~/fw/edk2-ws> cd ..
```

Download Checkout the Sha tag for edk2-platforms repo

```
$ ~/fw/edk2-ws> cd edk2-platforms  
$ ~/fw/edk2-ws/edk2-platforms> git reset --hard c546cc01f1517b42470f3ae44d67efcb8ee257fc  
$ ~/fw/edk2-ws/edk2-platforms> cd ..
```

(reset to this commit since this is used with all the labs)

DOWNLOAD LAB MATERIAL

Download the Lab_Material_FW.zip from :  [github.com](https://github.com/tianocore-training/Lab_Material_FW.zip)
[Lab_Material_FW.zip](https://github.com/tianocore-training/Lab_Material_FW.zip)

OR

Use git clone to download the Lab_Material_FW

```
$ cd $HOME  
$ git clone https://github.com/tianocore-training/Lab_Material_FW.git
```

Directory Lab_Material_FW will be created

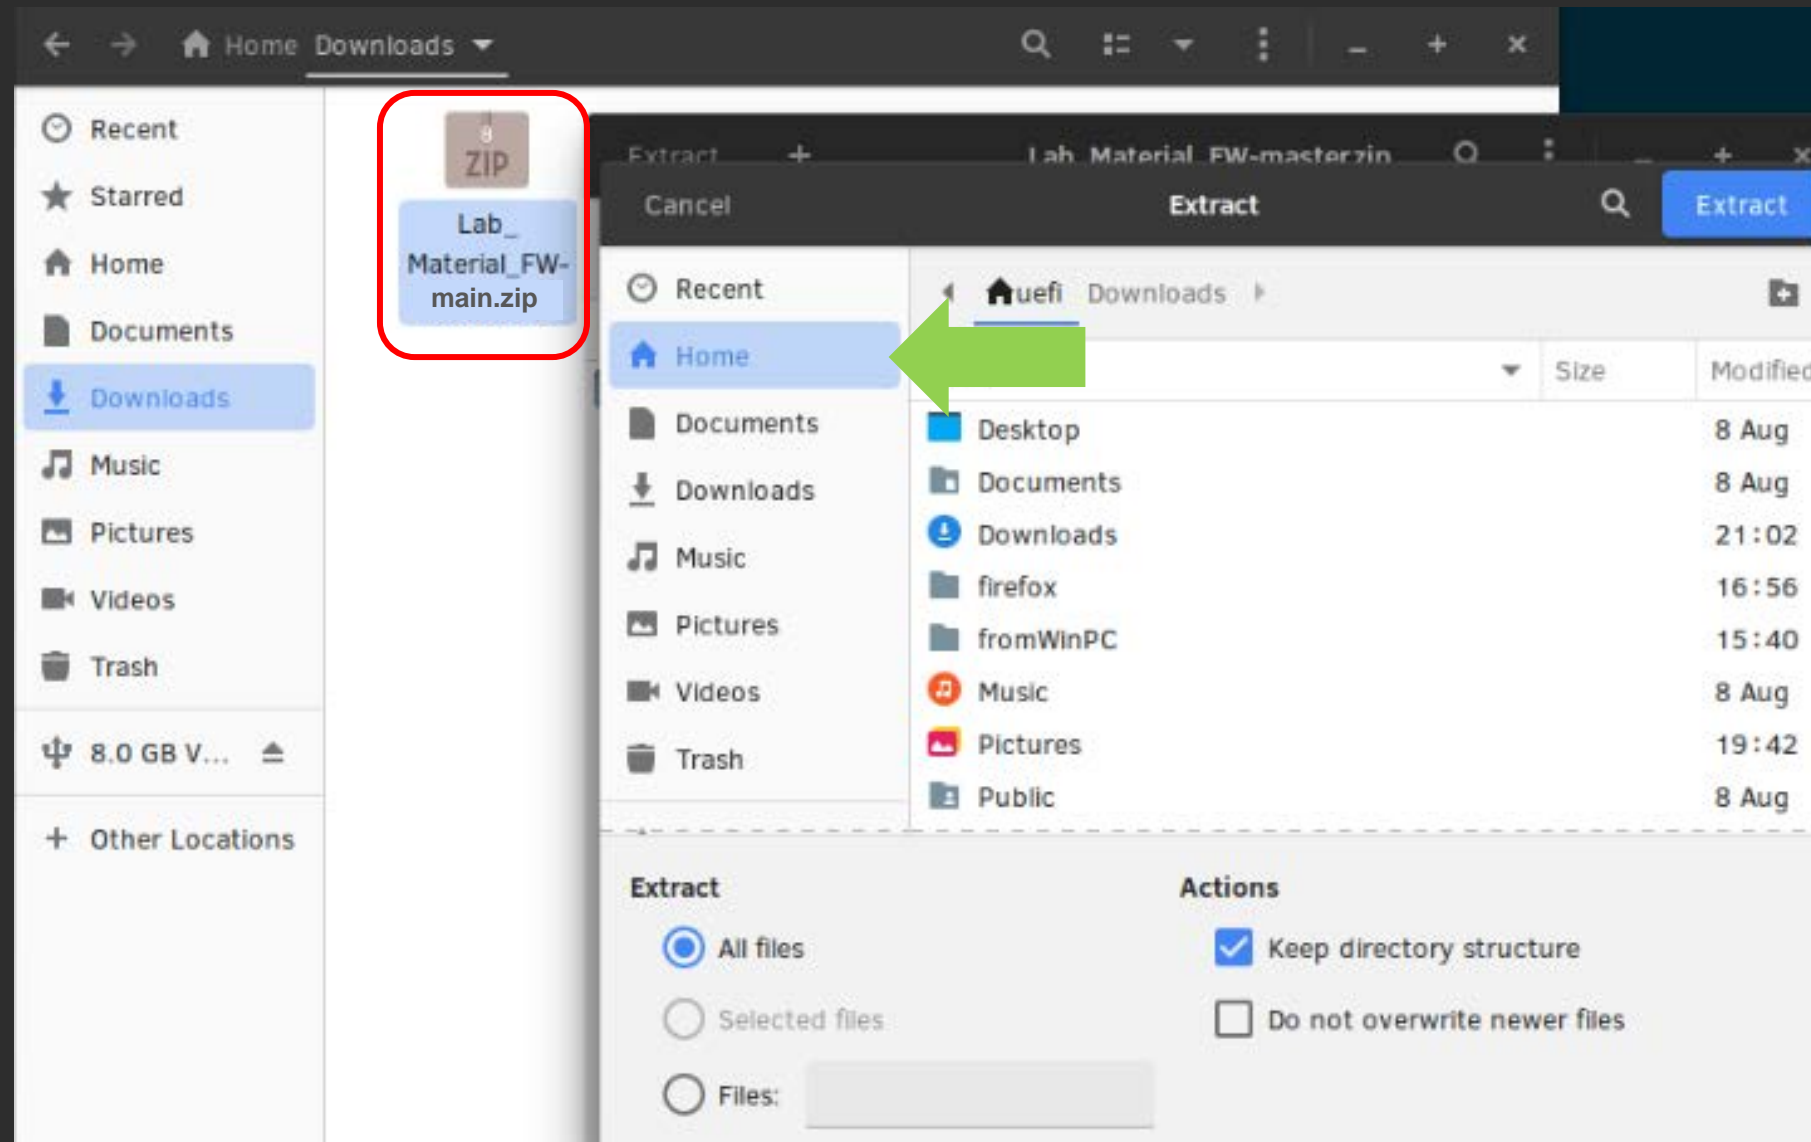

FW

- Documentation
- DriverWizard
- edk2-ws
- edk2Linux
- LabSampleCode

BUILD EDK II OVMF

-Extract the Source

1. Extract the Downloaded Lab_Material_FW-main.zip to Home (this will create a directory ~/FW)

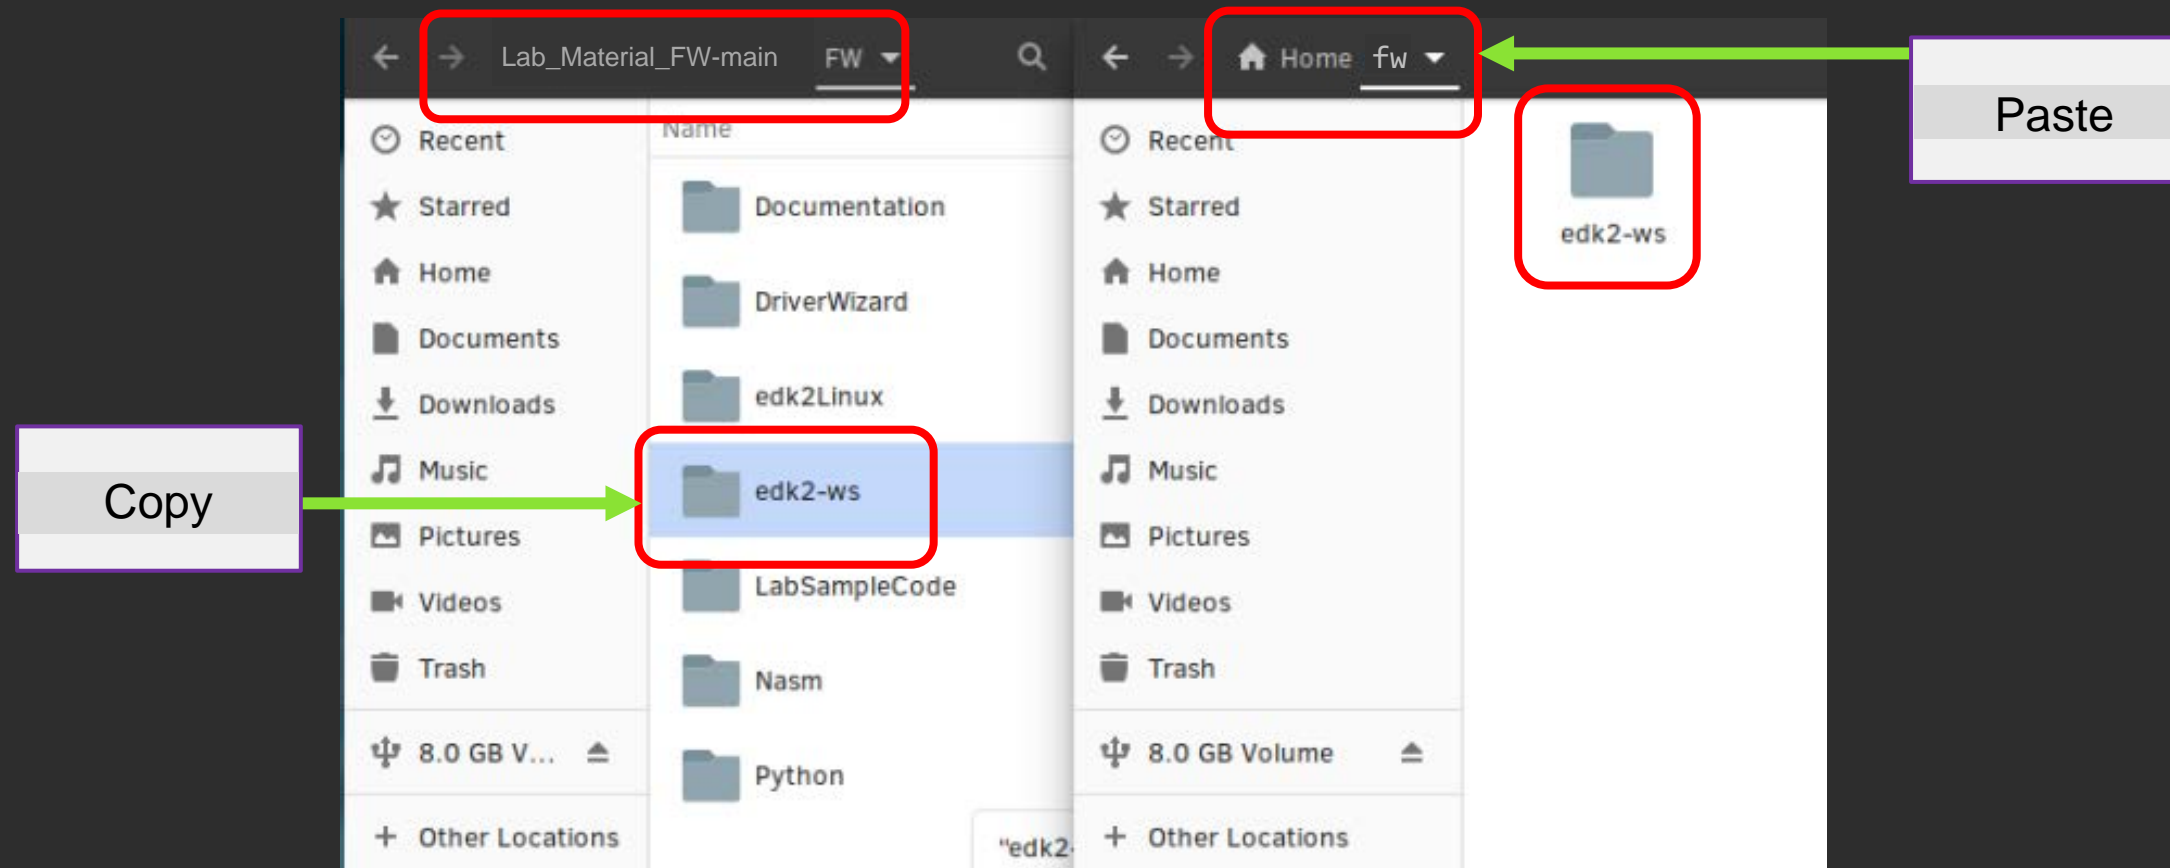

BUILD EDK II OVMF

- Copy the Source

2. Open a terminal prompt (Alt-Ctrl-T)
3. Create a working space source directory under the home directory

```
bash$ cd ~fw
```

4. From the FW folder, copy and paste folder “~Lab_Material_FW/edk2-ws” to ~/fw

BUILD EDK II OVMF

- Building BaseTools

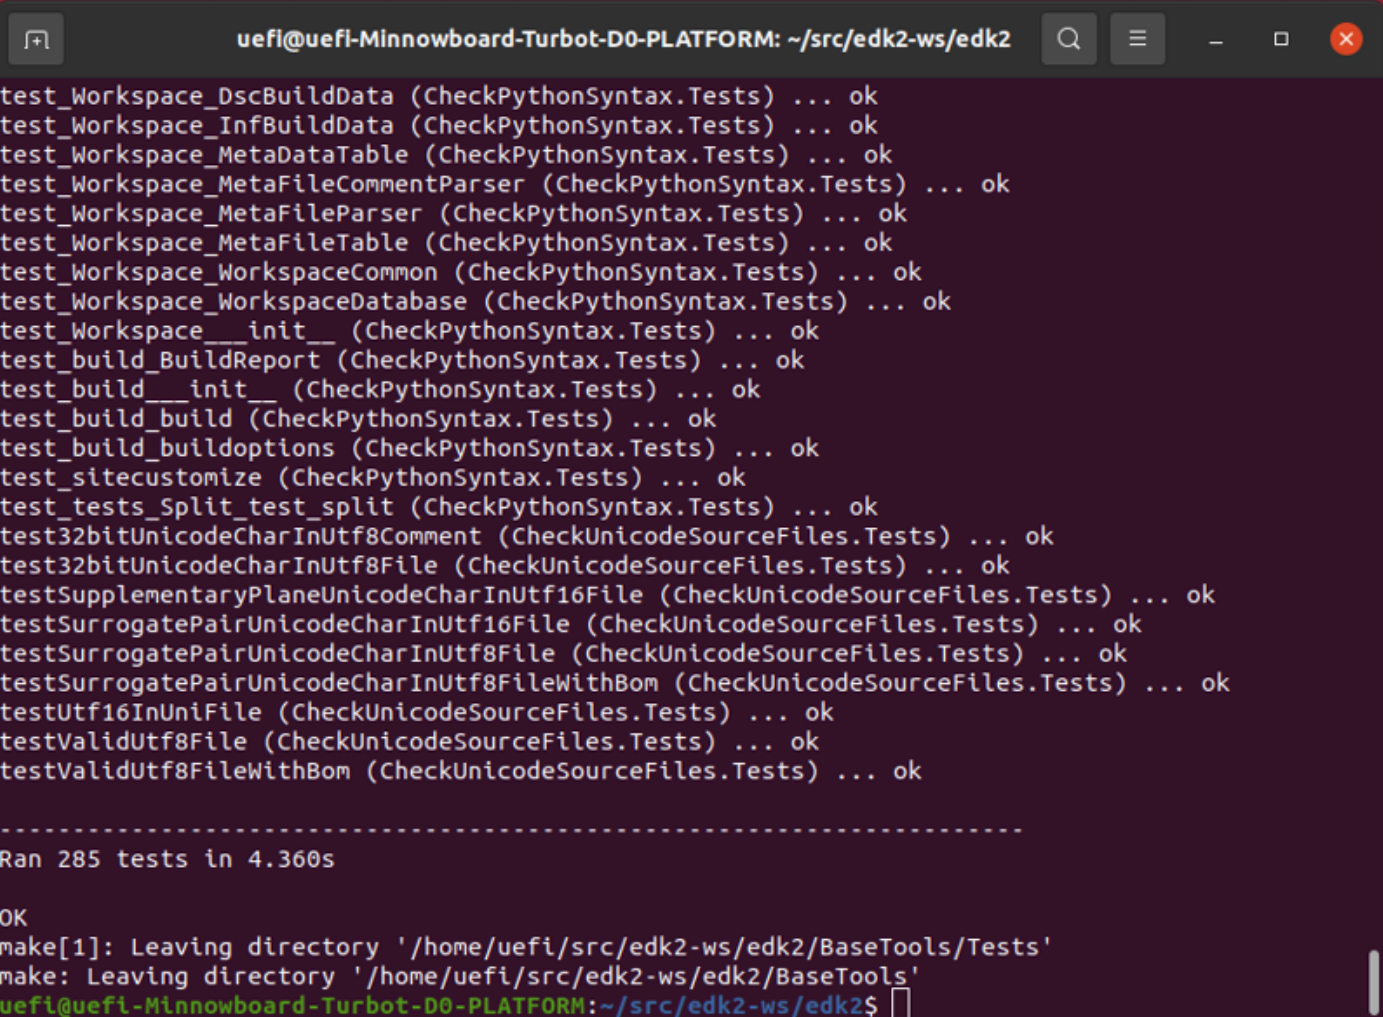

5. Export work space & platform path

```
$ cd ~fw/edk2-ws  
$ . setenv.sh  
$ export WORKSPACE=$PWD  
$ export PACKAGES_PATH=$WORKSPACE/edk2:$WORKSPACE/edk2-libc
```

6. Run Make

```
$ cd edk2  
$ make -C BaseTools/
```

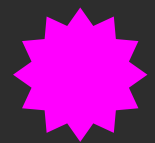

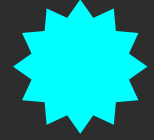

7. Make sure the tests pass OK

```
uefi@uefi-Minnowboard-Turbot-D0-PLATFORM: ~/src/edk2-ws/edk2  
test_Workspace_DscBuildData (CheckPythonSyntax.Tests) ... ok

Pre-requisites Ubuntu 16.04

Instructions from: [tianocore wiki Ubuntu_1610](#)

Example Ubuntu 16.04

The following need to be accessible for building Edk2, From the terminal prompt (Cnt-Alt-T):

```
bash$ sudo apt-get install build-essential uuid-dev iasl git gcc-5 python3-distutils
```

build-essential - Informational list of build-essential packages

uuid-dev - Universally Unique ID library (headers and static libraries)

iasl - Intel ASL compiler/decompiler (also provided by acpica-tools)

git - support for git revision control system

gcc-5 - GNU C compiler (v5.4.0 as of Ubuntu 16.04 LTS)

nasm - General-purpose x86 assembler (see below to install 2.15.05 or above)

python3 - distutils - distutils module from the Python standard library

Now need Nasm 2.15.x <https://www.linuxfromscratch.org/blfs/view/cvs/general/nasm.html>

The Following is needed for Mounting a .VHD file to use with Simics

```
bash$ sudo apt install libguestfs-tools
```

The following will install the QEMU for Intel X86 & 64 bit

```
bash$ sudo apt-get install qemu
```

ubuntu
